Ламінарні мастильні помпи ORV

Принцип роботи:

Принцип роботи масляного ротаційного пластинчастого вакуумного насоса базується на обертових ламелях. Ротор (2) розташований ексцентрично у верхній частині циліндричного статора (1), тому ротор майже торкається статора. Ламелі (4) притискаються до стінки статора відцентровою силою. Між двома ламелями та статором відбувається зміна об'єму компресійних камер (7) під час обертання статора, завдяки чому відбувається всмоктування газу.

Масло в насосі використовується як мастило для внутрішніх частин і забезпечує ущільнення ламелей зі статором, що сприяє досягненню вищого вакууму.

Характеристики:

- > Компактні і прості в установці
- > Низькі вимоги до обслуговування та зносу завдяки оптимальним обертанням валу
- > Низький рівень шуму та вібрації
- > Тиха робота без вироблення тепла
- > Екологічно чисті
- > Довготривалий термін експлуатації ламелів
- > Мінімальне обслуговування
- > Безперервна робота
- > Низький рівень шуму та вібрації

Застосування:

- > Упаковка
- > Дегазація
- > Пневматичний транспорт
- > Сушіння
- > Обробка та зберігання
- > Дистиляція
- > Евакуація
- > Формування, тиснення і ламінування
- > Видалення відходів
- > Нанесення покриття

- 1) Статор
- 2) Ротор
- 3) Карбонові ламелі
- 4) Вхід
- 5) Вихід
- 6) Компресійна камера

2

Rotary vane pumps RVT

Rotary vane vacuum pumps are suitable for use in the area of heavy vacuum and pressure. They can be used for the evacuation and transport of air or dry gases which are not toxic, aggressive or explosive. They represent the simplest and most suitable system wherever you need a precise source of vacuum without additions. They are applicable for sucking off in the small closed systems.

Principle:

The principle of operation of the rotary vane vacuum pump is based on the rotating lamellas. Rotor (2) is situated excentric on the top in the cylindrical stator (1), so rotor is almost touching the stator. The lamellas (4) are pushed towards the wall of the stator by centrifugal force. Between two lamellas and stator it comes to the volume change of the compression chambers (7) by stator rotation, due to this fact the gas is sucked.

Advantages:

- > oil-free operation
- > source of the vacuum without additions
- > compact and reliable construction
- > easy installation and maintenance
- > low weight and dimensions
- > continuous running without vibrations
- > economic operation

- 1) Stator
- 2) Rotor

Piston pumps VP (Piston vacuum pump)

The best attributes of piston and membrane equipment are combined together into the piston vacuum pumps (compressors) - into one small and compact unit. Deeper vacuum can be reached by the series connection of the pistons (for double pistons version). The flow will be increased by parallel connection. Due to the fact that operation of the piston pumps is oil-free, these pumps are suitable for those applications where contamination of the medium by oil mist is undesirable.

Principle:

The basic principle of the piston pumps is based on linear reversible movement of the piston (1) in the cylinder (2). The piston is moving by piston rod (3), which is driven by the winch by force of cam mechanism (4) – conversion of rotary motion to linear. The piston is sealed towards the cylinder by the piston ring (5), which has high thermal conductivity and low friction without need to lubricate it. By movement of the piston in the cylinder downward the air is sucked through a one-way suction valve (6) into the compression chamber. By movement of the piston upwards, the air is pushed away by the one-way exhaust valve (7).

Advantages:

- > Not required operation liquid - oil-free operation
- > The pumps reach deep vacuum
- > Low noisiness
- > Compact construction
- > Low weight
- > Do not contaminate the transported gas
- > Easy installation
- > Low temperature at the pump head
- > Long life-time

4

Liquid ring pump LRX, LRM

4

Liquid ring pump

Liquid ring vacuum pumps LRX and LRM are designed primarily for exhaustion of vapors and gases in various industries such as food and chemical industry. They are also used for evaporation, drying and packaging of the goods. Their big advantage is the fact they can evacuate gases with particles of liquid (vapor) as well as medium with a slight mechanical contamination (without abrasive effect).

Principle:

Rotor with fixed blades (1) is rotating in the stator (2), in which is situated eccentrically. Water ring is created from the service liquid (3) by the centrifugal force. The vacuum is formed and the pressure is changed in the compression chambers (4) between the blades and water ring. During the operation, the pump has to be supplied by adequate quantity of service liquid to achieve desired performance. Service liquid is also very useful for cooling of the liquid ring vacuum pump and for receiving possible contamination of sucked gas.

Advantages:

- > Oil-free operation
- > They are suitable for suction of gases and vapors
- > They can reach relatively deep vacuum
- > They are able to work simultaneously with the gas and liquid
- > Anti cavitation protection is ensured by installation of anti-cavitation valve
- > Safe operation with minimal maintenance
- > Smooth running without vibration
- > Economic operation

Features of the Liquid ring pump LRX series

The difference between LRX5 and LRX6:

The performance of LRX5 and LRX6 is the same.

The size of LRX6 is longer.

Because LRX5 don't have the couplings between pumps and motors. The pump is installed with the same shaft with motor.

The pump shaft and motor shaft is connected by coupling for LRX6. So the materials of pump shaft can be SS304 or other ones. And can be installed with Explosion-Proof Motor.

* Please request 60 Hz data

Liquid ring pump LRX

Performance curves

Suction capacity and power consumption depending on inlet pressure.

The Characteristics are applicable for compression of 20°C dry air from inlet pressure to atmospheric pressure (1013 mbar) for nominal speed and drive with three phase motors. Ring liquid is water at 15°C . The tolerance of suction capacity is -10% and of the power consumption +10%. With different operating conditions performance characteristics change.
